Lumion is a 3D visualization program used to create images of objects and scenes using virtual cameras. If you're looking to add something extra to your Lumion preset, there are a number of plugins available that will add a lot of functionality to your project. You can find Lumion plugins here: <http://plugins.3dtotal.com/> The most important aspects of constructing your scene are the cameras. There are three types of cameras you can use in Lumion: Perspective, Orthographic, and Free. Perspective Cameras are the most commonly used camera type. They provide realistic perspective views of your scene, which can be used to showcase interiors or landscapes with ease. The perspective camera will allow for features such as Depth Of Field or motion blur when enabled, allowing for advanced rendering techniques to be applied. Orthographic Cameras provide flat representations of your scene without any perspective factors being applied to them. This type of camera can be used to create 2D renders that can be used as visualizations for web pages or as 3D models for other programs. Free Cameras are more commonly known as camera path cameras. These cameras allow you to create cinematic effects through the use of camera paths, this is especially useful for creating motion graphics, title sequences and walkthroughs. The free camera is particularly useful due to its relative ease of use. Replace a Camera with a Free Camera: If you want to replace a Perspective or Orthographic Camera with a Free Camera, simply click on the drop-down menu under the "Camera" section of the Lumion toolbar and select "Free Camera".
